### COTTON: PRICE RECEIVED BY FARMERS, PARITY PRICE, AND PRICE RECEIVED AS PERCENTAGE OF PARITY, UNITED STATES, 1922-40

U. S. DEPARTMENT OF AGRICULTURE

NEG. 39190 BUREAU OF AGRICULTURAL ECONOMICS

PRICES RECEIVED BY FARMERS IN THE 1941-42 SEASON ARE LIKELY TO AVERAGE A HIGHER PERCENTAGE OF PARITY THAN IN ANY OF THE PAST 12 YEARS BECAUSE OF MANDATORY LOANS OF 85 PERCENT OF PARITY. THE "PARITY PRICE" FOR COTTON IS THAT PRICE WHICH WILL EQUAL IN PURCHASING POWER THE AVERAGE PRICE RECEIVED BY FARMERS FOR COTTON FROM AUGUST 1909 TO JULY 1914. THE PRICES RECEIVED BY FARMERS FOR COTTON VARY MORE FROM MONTH TO MONTH AND FROM YEAR TO YEAR THAN DO PRICES PAID BY FARMERS, INCLUDING INTEREST AND TAXES, AND HENCE MORE THAN DO PARITY PRICES. NOT SINCE JULY 1928 HAS THE FARM PRICE OF COTTON EQUALED OR EXCEEDED PARITY.

#### THE COTTON SITUATION

#### Summary

It is now estimated that the world agricultural cotton crop for the 1940-41 season will be approximately 29.7 million bales produced from 75-1/2 million acres. This production estimate is 800,000 bales, or 2.8 percent, larger than the estimate for the preceding season and 1.3 million bales above the average for the period 1930-39. With the exception of 1936 and 1937, this is the largest production on record. The largest absolute gains over 1939-40 occurred in the United States which increased 749,000 bales or 6.3 percent; India which rose 705,000 bales or 17.0 percent; and China which gained 471,000 bales or 25.0 percent. Russia which had a decline in production of 1 million bales or 25 percent, and Argentina where the reduction is 135,000 bales or 37 percent, show the largest losses from last season's level.

The 1940-41 acreage of cotton is estimated at 75-1/2 million acres, an increase of 3-1/2 million (4.9 percent) over 1939-40. The harvested acreage of cotton in the United States in 1940 was 23,861,000 acres. This was slightly larger than in 1939 but 24 percent below the 1930-39 average. In India the 1940-41 acreage was 1-1/2 million acres (7 percent) above that of the preceding year.

During the month ended May 26 the 10-market price of Middling 15/16 inch cotton advanced almost 2 cents per pound and on May 26 established a new high of 13.00 cents for the period since July 1937. This price rise is largely attributable to anticipation of the mandatory loan of 85 percent of parity on the 1941 crop. Under the stimulus of the rising prices, which have advanced about 3-3/4 cents from the season's low of 9.27 cents in

mid-October, large quantities of Government loan cotton have been repossessed. Repossessions since April 1 total over 1 million bales, including nearly 240,000 bales of 1938 loan cotton and 800,000 bales of 1940 loan cotton. Approximately one-fifth of the small 1939 loan stocks were redeemed during the same period. In view of the assurance of a 1941 loan rate somewhat higher than the prevailing market price, many farmers who still own their loan cotton may hold in hope of obtaining a still higher price at a later date despite the fact that they now have a substantial equity in their cotton.

Consumption during April totaled 920,000 bales. This exceeded the record March consumption by 66,000 bales and was 48 percent above April 1940. Consumption for the 9 months, August-April, totaled just under 7 million bales compared with slightly under 6 million bales for the corresponding period last season. The higher level of consumption this season is due to large Government purchases of raw cotton and cotton textiles, and increased private demand accompanying the higher levels of industrial production and consumer incomes. The increased number of mills working on week-ends or adding additional shifts contributed to a higher daily consumption rate in April and resulted in a seasonally adjusted index of cotton consumption of 156 percent of the 1935-39 average, a gain of 9 points over the previous record established in March.

The cloth market was relatively active with sales above production from the last week in April until the middle of May. More recently trade sources report textile offerings have been quite limited and many buyers have been unable to place orders. The backlog of unfilled orders is sufficiently large, however, to insure a continued high level of consumption well into next season. The prices of cotton cloth continued to advance in April and early May.

MAY 1941

During April 74,000 bales of cotton were exported from the United States, of which 21,000 went to China, 19,000 to Canada, and 11,000 to Japan. This makes a total of 904,000 bales for the first three-fourths of the current season, a reduction of 84 percent from a year ago and 81 percent from the average for the period 1935-39.

-- May 31, 1941

#### PRICES

BACKGROUND. Most of the time since 1929, when the United States Government through the Federal Farm Board made the first price-supporting loans on cotton, Government loans or prospective loans have had an important influence on domestic cotton prices. During the past few months this influence probably has been greater than ever before. This resulted from the consideration and final passage of legislation making mandatory for the 1941 season a loan equal to 85 percent of the "parity" price. This compares with a 1940 loan only a little above the minimum of 52 percent of "parity" required under previous legislation. In the 6 other years since 1933 in which there have been Government loans the basic loan rates for Middling 7/8" cotton have been from about 52 to 74 percent of the parity price existing at the time the loan rate was announced. In April this year the parity price of cotton was 16.00 cents. At this level of parity the average 1941 loan rate would be about 13.6 cents.

### Prospective 1941 loans raise prices 3-1/2 cents above 1940 loan rate

For some time prior to the passage by Congress, about the middle of May, of legislation requiring a 1941 loan of 85 percent of parity the prospects for its passage resulted in sharp advances in cotton prices. These and further subsequent gains accounted for an advance of 1.98 cents during the month ended May 26. The average ten-market price for Middling 15/16" of 13.00 on May 26 was the highest since the end of the 1936-37 season and about 3-3/4 cents per pound above the 1940 loan level. It was also about 3-5/8 cents above the prices prevailing in October, when prices in the ten markets averaged approximately the same as the loan rate for Middling 15/16". The price received by farmers for their cotton on April 15 was 10.45 compared with an average price of Middling 15/16" in the ten markets of a little over 11 cents. If the price received by farmers since that date advanced by the same amount as the ten-market price of Middling 15/16" the farm price during the last part of May was about 12-1/3 cents. This is about 77 percent of the April parity farm price of 16.00 cents per pound and 1.3 cents less than 85 percent of the April parity level of 13.6 cents, tables 2, 3, 4, and 9.

CS-55 - 5 -

The exact loan rate for a given quality and location under the new legislation has not yet been determined. Last year the loan rates varied according to quality and location and presumably the same will be true again this year. Should the location differentials be the same as in 1940 which is not necessarily to be expected - the rate for a given quality would vary by as much as 3/4 cent from one area or point to another. larly, the rate in a given area or market for Middling 7/8" would be about 1/4 cent less than that for Middling 15/16". Furthermore, with each additional change of one point in the index of prices paid by farmers, including interest and taxes, the parity price will change nearly 1/8 cent per pound. If the loan rates should be based on parity prices as of July or August, they might be as much as 1/2 cent higher or lower than if based on parity for April. Under the stimulus of prospective higher loans on the 1941 crop, futures prices at New York made advances from 2.07 to 2.30 cents per pound during the month ended May 26. The greatest gains occurred in new crop contracts, which sold for as much as 13.43 cents, compared with the New York spot price of 13.63 cents for Middling 15/16" cotton on the same date.

Since the Liverpool Cotton Exchange closed March 31 it is no longer possible to get prices of the various major growths of cotton in any one foreign market.

The price of Indian cotton at Bombay has gained 2/3 cent in the last month and on May 23 was quoted at 6.70 cents per pound, table 1. Except for one week in March, this is the highest since December. However, it is still materially below the 1939-40 average of 8.13 cents per pound. Brazilian cotton at Sao Paulo was quoted on May 23 at 6.52 cents. This was about 0.12 cent below the level a month earlier and 2-1/2 cents below the 1939-40 average. With prices in the United States having increased much more than prices in India and Brazil the indications are that recent changes have favored the use of foreign growths. However, there may have been changes in transportation costs and available shipping space sufficient to influence materially comparative prices of these growths in import markets. At least these factors together with relative foreign exchange rates and local supply and demand conditions frequently prevent price changes in export markets from being accompanied by comparable changes in import markets.

#### EXPORTS

BACKGROUND. During approximately the last 100 years exports of cotton from the United States have almost invariably constituted from 40 to 80 percent of the season's crop. This was true each season from the Civil War period through 1936-37. From 1918 to 1937 annual domestic exports ranged between approximately 5 and 11 million bales of cotton, and despite the downward trend of recent years averaged 6.3 million bales for the 10 years ended July 1940. Prior to the outbreak of the present war the trend in exports from foreign countries was sharply upward, particularly during the last several years of the period. Increased exports from Brazil and a number of smaller exporting countries accounted for most of this increase, even though exports both from India and Egypt in 1936-37 were at or very near record levels.

Exports of American and foreign cotton have been greatly reduced since the outbreak of the present European war.
Military blockades, limited shipping facilities, and import
restrictions by foreign Governments have been largely responsible for this decline. These factors, plus the relatively high
domestic market prices, have resulted in the restriction of exports from the United States much further than those from most
other countries.

#### Unfavorable outlook for exports of American cotton

As previously indicated, prices of Brazilian cotton at Sao Paulo declined 1/8 cent during the past month, and prices of Indian cotton at Bombay advanced about 2/3 cent, while almost phenomenal advances occurred in domestic prices of American cotton. Except for possible offsetting developments in exchange rates or transportation facilities, such changes in the price relationships in export markets, if maintained, would encourage importers to purchase larger proportions of the relatively cheaper growths and smaller proportions of American. This would be a natural development unless proportionate advances in the price of foreign cotton occur to offset the advances in the price of American cotton attributable to the 85 percent of parity loans. Even if there were no price disparities, it is unlikely that American exports would be as large as formerly due to the generally low level of consumption in most foreign countries. Shipping and exchange difficulties resulting largely from the wars in Europe and Asia have also tended to keep foreign trade in cotton at a minimum. There are, however, several factors which may partially offset the effects of these conditions.

One such factor is the particular character of American cotton which makes it especially suitable for certain uses. This was an important factor for many years. However, improved technology has wide ned the variety of uses to which certain kinds of cotton can advantageously be put. Then too, the production of a kind of cotton which is essentially similar to American has been rapidly expanded in Brazil. There is, therefore, little chance that the particular character of American cotton will be effective in preventing more than a small part of the shift to other growths resulting from the price differences. An example of how a country may shift from one growth to another is found in Canada, where mills are now turning to Brazil for about two-thirds of their requirements of cotton whereas formerly the United States supplied over 90 percent of their needs. This shift was occasioned by the relative cheapness of Brazilian cotton in terms of American. With the prospects for an even wider price disparity next season, Canada and other countries may shift even more to other growths if shipping space can be obtained.

The volume and nature of shipping space on ocean runs also may be an offsetting factor. This takes two forms, one of which relates to the volume of available shipping space from exporting points to consuming countries, the other to the charge for shipping space. This season, for example, the relative scarcity of space from Brazil to the Orient has prevented larger Brazilian shipments to the area and perhaps has caused American exports to be larger than they otherwise would have been. Recently, it has been

CS-55 - 7 -

reported that some of the northbound ships which have been transporting Brazilian cotton for Canadian use may not be available next season. may result in larger American exports to Canada despite the price disparity. This and similar developments which may become more intense as the war progresses could work to the relative advantage of American cotton compared with foreign. A number of factors contributed to the lew level of American exports this season. One of these is the generally low level of consumption in many countries. Except in the United States, India, and Canada, where consumption this season is at record levels, the consumption in most other manufacturing countries is greatly restricted. In continental Europe consumption is, of course, restricted by the inability to import raw cotton. In Japan consumption has been restricted by lack of outlets for mounting 'stocks of textiles. In the United Kingdom the need to conserve shipping space and to divert labor and other productive resources to the making of munitions has resulted in a declining level of cotton consumption. All of these are attributable directly or indirectly to the present European and Asiatic wars.

Many nonproducing countries have curtailed imports to a greater extent than consumption. This is purely a short-run phenomenon made possible by utilizing the fairly large stocks of raw cotton on hand at the time of the intensification of hostilities. These stocks are being rapidly depleted, so consumption must be still further curtailed unless imports are increased. In any case, large world supplies of raw cotton will be competing for smaller than normal foreign markets.

American exports during April totaled 74,000 bales, making a total of 904,000 bales for the first three-fourths of the current scason (table 5). During the first 9 months of this season exports to Europe, including the United Kingdom, declined 86 percent from last season's level. Likevise, exports to the Orient declined 87 percent and to countries in the Western Hemisphere 56 percent. Russia took no cotton last season but has taken 139,000 bales to date this season. Canada is the only other one of the 6 countries taking as much as 30,000 bales this season whose takings constitute as much as 20 percent of their corresponding level last season. All of the exports this season have been to countries which last season accounted for two-thirds of our exports, but even these have taken less than one-fourth of their corresponding figures a year ago.

With the British Government the sole importer of cotton into the United Kingdom and with 87,000 bales of barter cotton still remaining in this country on May 1, it is very doubtful that any important commercial shipments of American cotton to the United Kingdom will be made before the remainder of the barter cotton is shipped. At the level of shipments which has prevailed during the last 5 months, this might be as late as November. It is significant, however, that British stocks of raw cotton are now apparently very low. This might result in increased imports despite the recent restrictions in consumption.

Peru exported a total of 226,000 bales (500 lb. gross weight) during the first 9 months of this season, a reduction of only 12 percent from last season's level. One important shift which has occurred this season has been the growing importance of Japan as a customer for Peruvian cotton. Formerly

the United Kingdom accounted for about half of Peru's exports, but this season Japan has taken 144,000 bales compared with only 26,000 bales during the corresponding period last season.

One of the lesser, though fairly important, exporting countries is the Anglo-Egyptian Sudan. This country, like Brazil, is one of the few countries whose exports are larger this season than a year ago. Through March, exports from that country totaled 154,000 bales of 478 lb. net weight or nearly twice the 80,000 bales a year ago. Last season exports from the Anglo-Egyptian Sudar included 33,000 bales to India and 18,000 bales to the United Kingdom. This season they included 62,000 bales to India and 87,000 bales to the United Kingdom. Exports from Egypt through April totaled 507,848 bales, a reduction of 64 percent from a year ago.

#### DEMAND AND CONSUMPTION

BACKGROUND. - Domestic cotton consumption averaged 6.9 million bales per year for the 5 seasons 1935-39. This season, however, the national defense program with its direct Government purchases of cotton textiles and its effects on consumer incomes, industrial production, and generally improved business activity, will play a large part in raising consumption to a level much above the previous high of almost 8 million bales. The low level of cotton consumption in most foreign countries stands out in sharp contrast with the favorable domestic consumption situation. The present European and Asiatic wars have cut off some countries from their sources of raw cotton, some from their markets for textiles, and in some so increased the domands on limited shipping space, foreign exchange, and labor and power resources that cotton consumption has been sharply curtailed.

### United States consumption over 1 million bales sheed of last season

The 920,000 bales of cotton consumed domestically in April exceeded the record March consumption by 66,000 bales and exceeded that of April 1940 by 48 percent. Consumption for the 9 months, August-April, totaled 6,995,000 bales to exceed by slightly more than 1 million the near-record consumption during the corresponding period last season.

Government purchases of cotton textiles for military and relief purposes have been an important factor contributing to the record cotton consumption this season. Another important factor has been the Department of Agriculture's Cotton Mattress Programs through which 290,000 bales of low-grade cotton have been distributed since the beginning of the season for use by low-income and relief families. Improved business activity and larger consumer incomes resulting in large part from the national defense program are also reflected in a greatly expanded civilian demand for cotton textiles.

The increase in production which occurred in April is attributable in part to the additional working day during April. Other factors include the increase in the number of mills adding additional shifts and the number of

mills operating on weekends. The higher daily consumption rate during April is reflected in the advance of 9 points in the Federal Reserve Board's seasonally adjusted index of cotton consumption, which rose from the March record of 147 to a new high of 156 percent of the 1935-39 average. The index of spindle activity also advanced from 116.7 in March to 119.6 in April, compared with 92.0 in April 1940. This index is based on activity of 80 hours per week.

Following a period of feverish selling, sales of unfinished cotton textiles were exceeded by production from the last week in March until the last week of April. Since that time, however, sales have been reported at about 1-1/2 to 2 times production. This has further expanded the volume of unfilled orders, which were already sufficient to assure a continuing high level of consumption well into next season.

Wholesale cloth prices continued their advance in April and May. The average wholesale price of 17 constructions of gray goods advanced from 28.90 cents in March to 31.05 cents in April. The largest advances occurred in sheetings, which made advances of 2.99 cents. Trade reports indicate that the average for May will be still higher. Manufacturers' average gross margin on the 17 constructions increased from 18.17 cents in March to 19.81 cents in April. This is the highest level in the 16 years for which the margins on these constructions are available. While data for May are not yet available, it appears probable that the sharp advance in raw cotton prices tended to offset the increase in cloth prices, thereby preventing a corresponding increase in the average manufacturers' gross margin.

### Reorganization of British cotton textile industry still in progress

During early May it was reported that the concentration of the spinning section of the British cotton textile industry was about half accomplished
and that some progress was being made in the concentration of the weaving
section. By July it was thought that the reorganization of the spinning section would be completed. It has been reported that mills are reluctant to
accept new orders because of the uncertainty as to whether or not they will
be allowed to continue operating. In view of the decline in production in
recent months, production in the near future apparently may be confined to
essential Government requirements, highly selective export trade, and bare
minimum requirements for the civilian population.

Between August 1 and March 14, 1,486,000 bales of cotton were reported delivered to Lancashire spinners. Of this amount 566,000 bales (38 percent) were American cotton. During the same period last season deliveries totaled 1,902,000 bales, of which 906,000 bales (47 percent) were American. American cotton thus suffered a decline of 38 percent compared to only 8 percent for foreign cotton.

Chinese and Manchurian cotton consumption totaled 122,000 bales during April for the second successive month. It is reported that the Chinese mills in the Shanghai area may soon reduce consumption materially below their present level of about 85 percent of capacity. Japanese mills in the

Shanghai area and mills in occupied China are expected to continue to operate at about 50 and 40 percent, respectively, of capacity.

During the past year cotton consumption has been at a very high level in India. Indian mills have had large military orders placed by both the British and Indian Governments. In addition there has been an increased demand in both the domestic and export markets. Indian mill owners are reported to be expanding capacity with a view to capturing the cotton textile markets which other countries, particularly European, are no longer in a position to supply. India has a large hand-loom industry in addition to the larger industrial textile mills. This group of hand-weavers is being encouraged by the Government to expand. The production of medium and longstaple cotton has been encouraged in India in recent years. Now, with the pressure to conserve foreign exchange and shipping space, the volume of cotton imports has been reduced. This is not only made easier by the larger production of longer staple cotton in India but is likely to cause a further expansion in the production of longer staple cotton. Indian imports at the present time are limited largely to cotton from the Anglo-Egyptian Sudan, British East Africa, and Egypt. Only 500 bales of American cotton have been exported to India this season compared with 89,000 a year ago.

#### Foreign statistics affected by war

One of the effects of the present European and Asiatic wars is the growing scarcity of current statistics. A number of nations have suspended the issuance of series of data formerly reported at regular intervals. In addition, the war, through its effects on shipping space and the route mailed information travels, has often delayed the information which is available.

#### ACREAGE, PRODUCTION, SUPPLIES AND STOCKS

### 1940 world cotton production estimated at 29.7 million bales; acreage 76-1/4 million

The world agricultural cotton crop for the 1940-41 season is now estimated at approximately 29.7 million bales produced from 75-1/2 million acres (table 6). This production estimate is 800,000 bales (2.8 percent) larger than the estimate for the preceding season and 1.3 million bales above the average for the period 1930-39. With the exception of 1936 and 1937, this is the largest production on record. This season about two-thirds of the countries for which 1940-41 estimates are available show increases in production over last season. The largest gains over 1939-40 occurred in the United States, which increased 749,000 bales or 6.3 percent; India, which rose 705,000 bales or 17.0 percent; and China, which gained 471,000 bales or 25.0 percent. Russia, which had a decline in production of 1 million bales or 25 percent, and Argentina, with a reduction of 135,000 bales or 37 percent, show the largest losses from last season's level.

There was also a substantial increase in cotton acreage in 1940-41 over the previous year. In fact, acreage increased 4.9 percent compared with the 2.8-percent increase in production (table 7). The largest changes in cotton acreage occurred in India, where there was a gain of 1-1/2 million

CS-55 - 11 -

acres or 7 percent, and in Russia, where there was a loss of 1/4 million acres or 5 percent.

### May crop report places 1940 production of cotton at 12,566,000 bales; harvested area at 23,861,000 acres

The report of The Crop Reporting Board on May 23 places the production of cotton in the United States during the 1940 season at 12,566,000 bales (500 lb. gross weight). This is about 749,000 bales (6.3 percent) more than in 1939 but 7.2 percent below the average for the period 1929-38 (table 8).

The area in cultivation on July 1, 1940 was estimated at 24,871,000 acres. This is slightly larger than the area in cultivation July 1, 1939. The estimate of harvested acreage was placed at 27,861,000 acres, or 56,000 acres more than in 1939 but 28 percent below the 1929-38 average.

Compared with the December crop report the production estimate was reduced 120,000 bales. This is largely accounted for by revisions in acreage. The estimated acreage in cultivation on July 1 was reduced 202,000 acres. The reductions were heaviest in Texas, Arkansas, and Mississippi, where the estimates were lowered 51,000, 46,000 and 33,000 acres, respectively. The heavy reduction in those States was probably attributable to an underestimation of the damaging effects of adverse weather conditions in that area during the early part of the growing season. Changes in the estimates of harvested acreage as indicated by the December and May crop reports were very similar to the changes in the estimates of acreage in cultivation on July 1. The estimate of harvested acreage was reduced 217,000 acres. Mississippi was the only State where the reduction in the estimate of harvested acreage was materially larger than the reduction in the estimated acreage in cultivation on July 1. The estimate of yield remained practically unchanged for the entire United States since the recent estimate of 252.5 pounds per acre was only 1/10 pound higher than the December estimate. Except for the year 1937, the United States average cotton yield for 1940 was the highest on record.

## Over one-half of 1940 Government loan cotton repossessed by May 10

Repossessions of 1940 Government loan cotton have continued relatively heavy in recent weeks and totaled slightly over 800,000 tales from April 1 through May 19. During this same period nearly 1/4 million bales of 1938 loan cotton and several thousand bales of 1939 loan cotton also were withdrawn. Repossessions of 1940 loan cotton have been much heavier in the States bordering on the Mississippi River than in other parts of the Cotton Belt. In those States over 84 percent of the cotton placed in the 1940 Government loan had been repossessed by May 17 compared with only 55 percent for the entire United States.

This large volume of repossessions of loan cotton accompanied rising cotton prices, which have now climbed to the highest level since July 1937. These price advances have been sufficient to give farmers a substantial equity in the loan cotton and many have liquidated their loans. It now

appears likely, however, that the assurance of a loan on the 1941 crop higher than the market price at the present time, may encourage producers who still have equity in their loan cotton to hold in hope of getting a price close to the 1941 loan rate.

According to a press release as of May 21 the Government may find it desirable to take title on August 1 to any cotton remaining pledged to secure notes which are overdue at that time. In such an event, at least 10 day's public notice of such action would be given. If the Government should take title to loan cotton, the cotton producers would be paid any amounts by which the redemption costs of their notes, including principal, interest, and carrying charges were exceeded by a fair value for the cotton at the time, a value which would be determined by the Secretary of Africulture on the basis of the then prevailing average market prices for cotton with reasonable allowances for differences in grades, staple lengths, and locations.

# Private estimates of United States acreage range from slightly above to slightly below 1940; boll weevil more numerous than in 1940

Private estimates of 1941 cotton acreage range from slightly above to slightly below the acreage in cultivation on July 1, 1940. The first official estimate of the acreage in cultivation on July 1 will not be released until July 8.

According to studies by the Department of Agriculture a larger number of boll weevil survived the winter than in any recent year. The increase in numbers does not necessarily mean serious damage to the cotton crop, but indicates that weevil conditions may become serious.

It is now estimated that cotton acreage in occupied North China may be as much as 20 percent above the 1940 level. In occupied Central China and unoccupied China a 10-percent reduction is expected. The total acreage for the entire country is expected to decline about 3 percent, but continuation of the present crop conditions would likely result in a production near last season's level.

Table 1.- Cotton: Spot price per pound and spread between prices in specified markets 10-year average 1927-28 to 1936-37 and 1936-37 to date

Prices at New Orleans are from records of the Agricultural Marketing Service.

Prices at Bombay are from Bombay Cotton Annual and Financial News through Oct. 1940;

since then from New York Cotton Exchange reports. They were converted from rupecs

per candy of 784 pounds at current rates of exchange (buying rates in recent weeks)

as reported by the Federal Reserve Board.

Prices at Sao Paulo are from official publications and cables. Prices were converted from milreis per 15 kilograms at current rates of exchange until Sept. 1934, Oct. 1934 to Feb. 10, 1935, at open or free market rates, and from Feb. 11 to date at composite averages of official and free market rates; except from Nov. 16, 1937 through Apr. 10, 1939 when free market rates were used. Prices at Alexandria are from the Monthly Bulletin of Agricultural and Economic Statistics. Prices were converted from tallaris per cantar at current monthly rate of exchange through Aug. 1939; since Sept. 1939 converted at official rate of exchange. American prices in the United States based on gross weight; all prices in foreign countries based on let weight.

The Liverpool Cotton Exchange was closed on Mar. 31.
Price on Sept. 30. 2/ Not available. 3/ Price on May 15. 4/ Price on May 22.

Compiled from reports of the Agricultural Marketing Service.

Average United States farm price in the 5 years August 1909-July 1914 of 12.4 cents times the index of prices paid by farmers, interest and taxes (payable per acre of farm real estate) (1910-14 = 100). Prior to 1923 only annual data on the index of prices paid are available, consequently monthly parity prices prior to that have not been computed.

Table 4.- Cotton: Farm price as a percentage of parity, March 1923 to date

Compiled from official sources and reports of the International Institute of Agriculture or estimated by the Bureau of Agricultural Economics.

1/ Exports.

2/ Based largely on exports, although actual production estimates are available for some of the Islands.

3/ By a decree of September 5, 1932, the territory of Upper Volta was distributed between Ivory Coast, Higer Territory and French Sudan.

4/ Esported only as less than 500 quintals (231 bales of 478 pounds not).

5/ Includes estimates for 20 to 30 minor producing countries, not included above, which in most of the relatively few years for which we have records collectively produced from 20,000 to 50,000 bales.

Compiled from official sources, and reports of the International Institute of Agriculture, or estimated by the Bureau of Agricultural Economics.

| On September 5, 1932 a decree was signed distributing Upper Volta between Ivory Coast, Figur Ferritory and French Sudan.
| Reported only as less than 500 hectares (1,235.5 acres).
| Java and Madura only.
| Includes estimates for 20 to 30 minor producing countries not included above which in most years for which we have records collectively harvested from 100,000 to 250,000 acres.

<sup>1/</sup> All annual data on an August 1 year. The annual figure is the simple average of the 12 monthly figures.

Preliminary.

<sup>2/</sup> Average United States farm price for the 5 years August 1909-July 1914 of 12.4 cents times the index of prices paid by farmers, interest, and taxes (1910-14 = 1.00).

Prices for 1929 through 1938 are the premiums of 15/16" cotton at six markets (Dallas, Galveston, Houston, Little Rock, Memphis, and New Orleans) added to the Drice of 7/8" cotton in the same markets. Since 1939 prices are as quoted on Middling 15/16" cotton in the 10 designated markets.

Mill margins on unfinished cloth (17 constructions).
Federal Reserve Board, adjusted for seasonal variati
Bureau of Labor Statistics 1926 = 100, converted to Federal Reserve Board, adjusted for seasonal variation.

Bureau of Labor Statistics 1926 = 100, converted to 1910-14 = 100.
